Semantic UI React

Great choice for devs familiar with semantic UI styles. Semantic UI React provides pre-built components adjustable by props.

The screenshot shows the Semantic UI React website. On the left is a dark sidebar with a navigation menu. The main content area is white and features the Semantic UI logo at the top, followed by the title 'Semantic UI React' and the subtitle 'The official Semantic-UI-React integration.' Below this is an 'Introduction' section with a list of features: 'jQuery Free', 'Declarative API', 'Augmentation', 'Shorthand Props', 'Sub Components', and 'Auto Controlled State'. The 'jQuery Free' section explains that jQuery is a DOM manipulation library and that React uses a virtual DOM. The 'Declarative API' section states that declarative APIs provide robust features and prop validation. At the bottom of the sidebar, there is an advertisement for Adobe Stock.

Semantic UI React
The official Semantic-UI-React integration.

Introduction

Semantic UI React is the official React integration for Semantic UI.

- ✓ jQuery Free
- ✓ Declarative API
- ✓ Augmentation
- ✓ Shorthand Props
- ✓ Sub Components
- ✓ Auto Controlled State

Installation instructions are provided in the [Usage](#) section.

jQuery Free

jQuery is a DOM manipulation library. It reads from and writes to the DOM. React uses a virtual DOM (a JavaScript representation of the real DOM). React only writes patch updates to the DOM, but never reads from it.

It is not feasible to keep real DOM manipulations in sync with React's virtual DOM. Because of this, all jQuery functionality has been re-implemented in React.

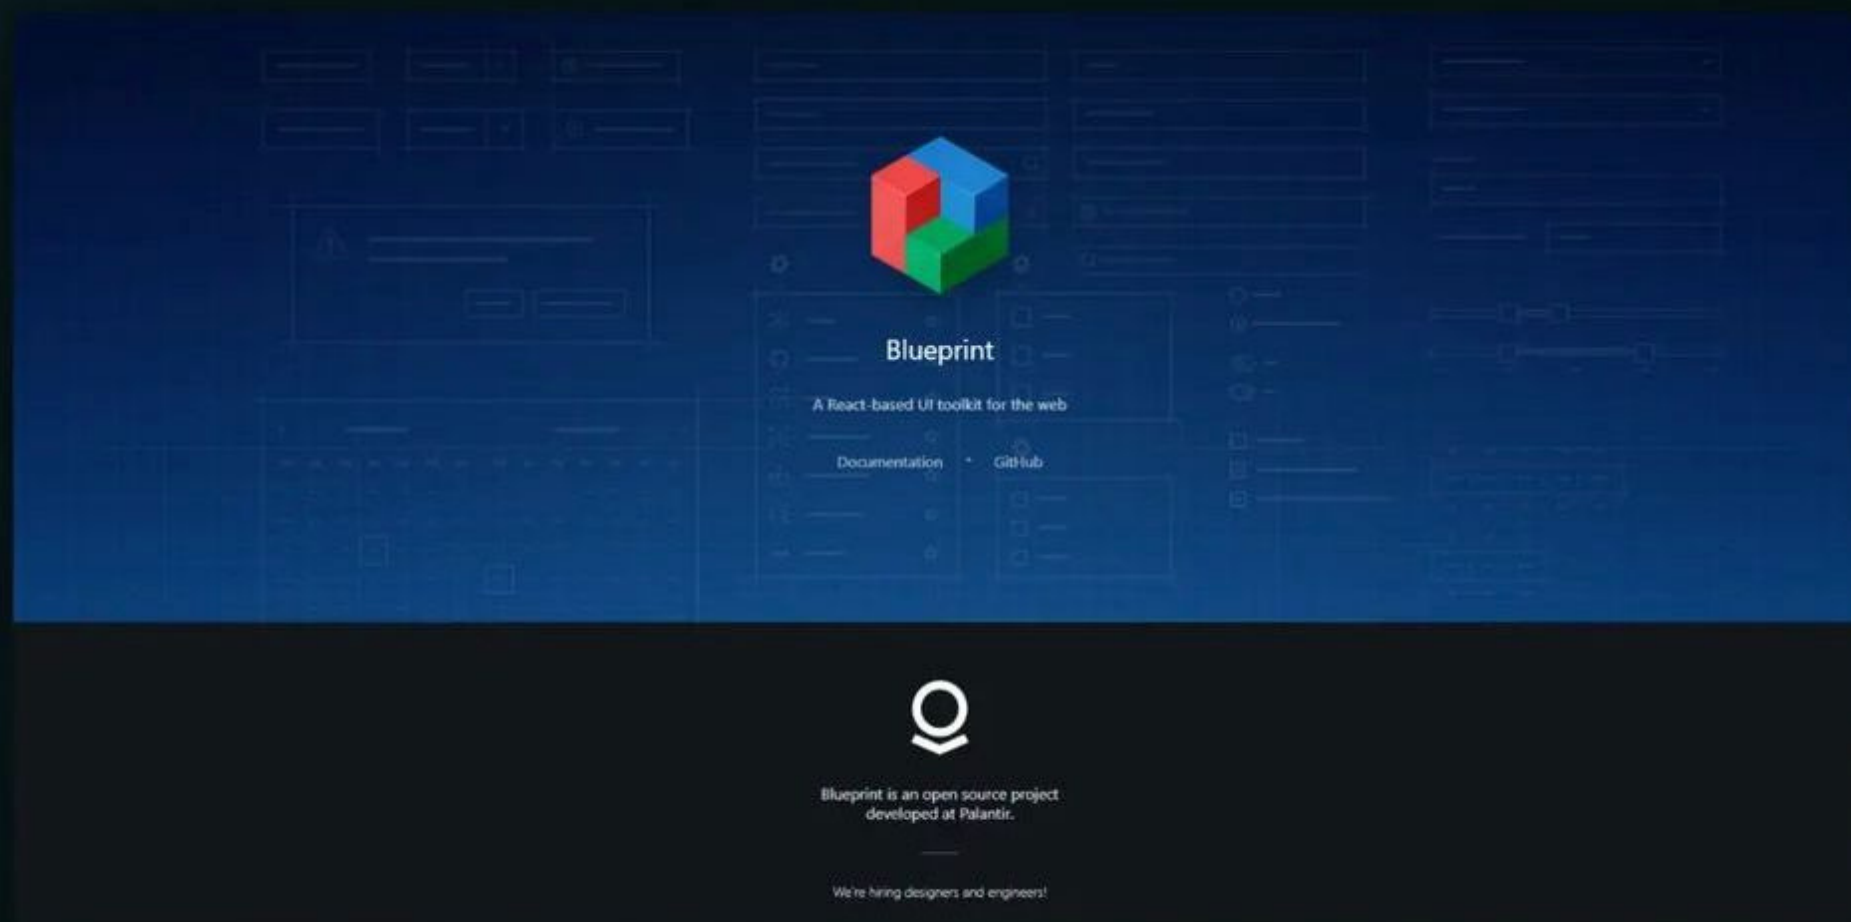

Declarative API

Declarative APIs provide for robust features and prop validation.

React Bootstrap

Great UI framework to get started with React. It's based bootstrap with the difference that React bootstrap provides React components based on bootstrap styles.
